

Vertiscreen

The Perfect Sunprotection Solution

The **Vertiscreen** vertical sunblind system has been designed to comply with the industry's demands for strength and efficiency whilst still keeping a neat and compact appearance, with minimal maintenance requirement.

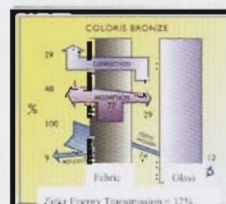

The compact lines and versatility of the **Vertiscreen** sunblind has been designed to satisfy the stringent requirements expected of modern sun protection blinds whilst enabling it to blend discretely to existing homes or commercial buildings. It is easily fitted, and in many situations can be installed inside the reveal.

Some of the many benefits achieved by installing a **Vertiscreen** will be improved insulation from heat gain or loss, UV shielding and a reduction of glare, resulting in lower air conditioning costs. The energy efficient design enables solar energy transmission to be as low as 12% due to the narrow gap between the glass and the fabric.

An opaque fabric can be used to create UV blockout, whilst an open weave fabric can offer sun protection without losing your precious view.

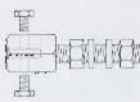

Vertiscreen can be operated by a gearbox, which is discretely fitted inside the cassette, or by use of a tubular drive motor. Motorisation will also allow options such as remote control, and group control over a number of windows simultaneously. Timing functions and climate controls are also available.

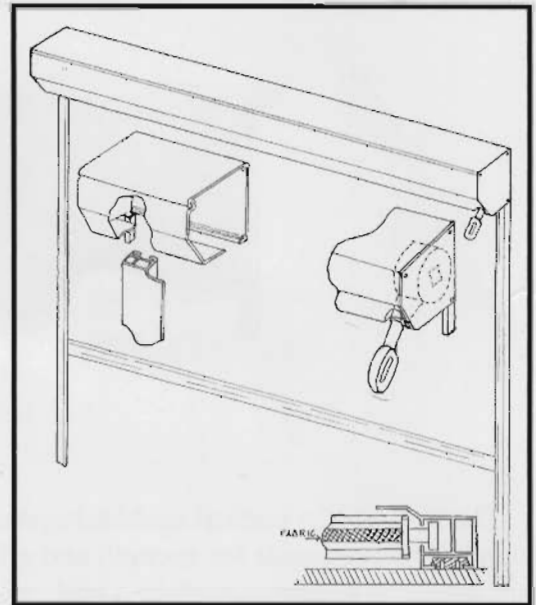

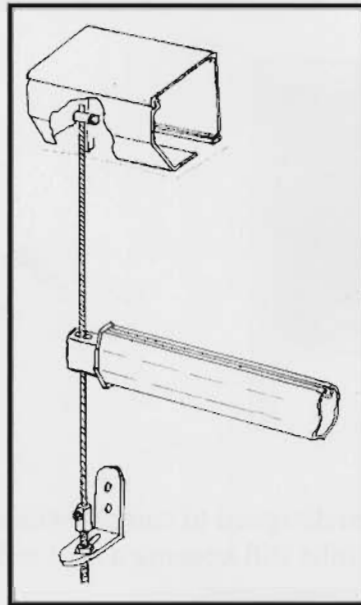

Your Vertiscreen Dealer

Vertiscreen 95 and 125

Cassette extrusion, back and front

Cassette end plate 95 or 125mm

Guide rail extrusion

Bottom rail end cap

Bottom rail extrusion

Bottom rail wire guide end cap

Face fit bracket for wire guide

Wire guide bush, top fixing

Wire guide bush, bottom fixing

Stainless steel guide wire 3.2

Originally designed for large projects such as hospitals and office buildings etc, the Vertiscreen is also ideal for the sun protection of the family home.

The unique Vertiscreen profile includes a neat 125mm x 125mm or a 95mm x 95mm cassette head box, square bottom rail and side channels, and is manufactured from high grade aluminum extrusion.

Powder coating to match existing colour schemes is available in all standard powder coat colours.

The screening material rolls down between two side channels, which eliminates the suns rays entering via the gap that is characteristic of conventional sunblinds.

As an alternative to the side channel system, the use of stainless steel wire cables is also available.
